Mr. Vincent Vespa
City Clerk
City Hall
Providence, Rhode Island

Dear Mr. Vespa:

I am enclosing copy of the Annual Report of the Water Supply Board for the fiscal year ended June 30, 1973, which has been signed by Mr. John A. Doherty, Chairman of the Board.

Thirty copies are being forwarded to your office for presentation to the members of the City Council at the next scheduled meeting.

Very truly yours,

John E. Rogers
Chief Engineer

THE SAME BE RECEIVED,

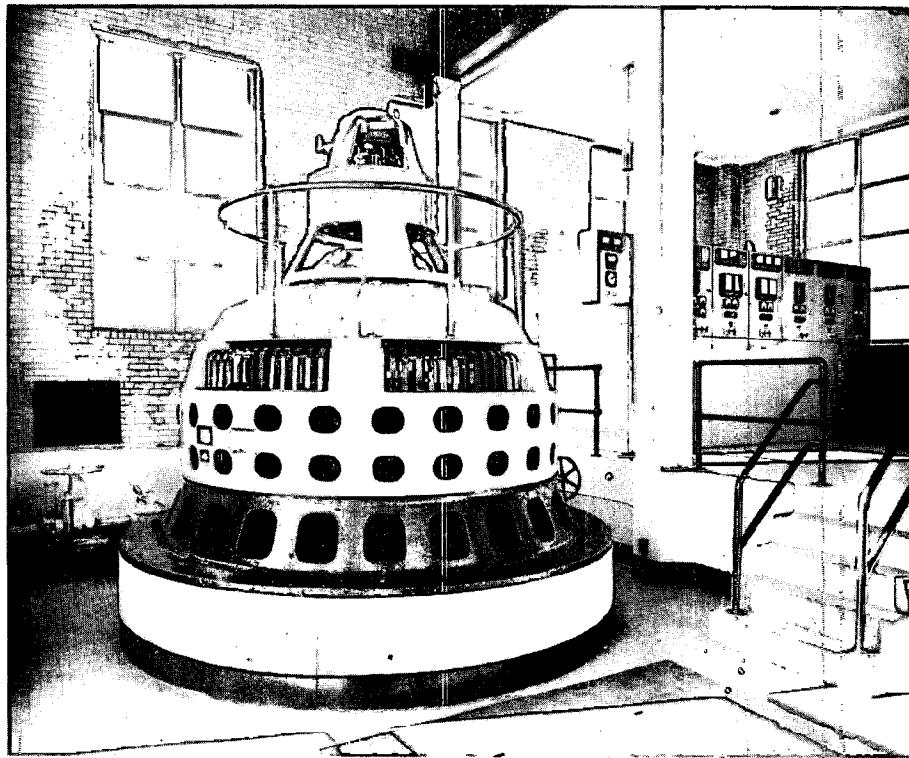

CITY DOCUMENT

James L. Murphy
CLERK

ANNUAL REPORT
of the
WATER SUPPLY BOARD
of the
CITY OF PROVIDENCE

For the Year Ended June 30, 1973

ABOUT THE COVER:

Westinghouse 2300 Volt-1875 KVA turbo generator in the hydroelectric station on Gainer Memorial Dam provides power to operate the Philip J. Holton Water Purification Works. In the right background is the switchgear, with individual high voltage cubicles.

Raw water is discharged through a water wheel located in the Gate House structure and into the north branch of the Pawtuxet River below the Dam. This flow operates the generator which produces electricity. Surplus energy is sold to the Narragansett Electric Company.

ADMINISTRATIVE OFFICE
WATER SUPPLY BOARD
CITY OF PROVIDENCE

July 1, 1973

TO THE HONORABLE JOSEPH A. DOORLEY, JR., MAYOR
AND THE HONORABLE CITY COUNCIL:

In compliance with Chapter XX of the Charter of the City of Providence, enacted by the General Assembly of the State of Rhode Island at its January Session, A.D. 1940, and approved April 26, 1940, we have the honor to present the thirty-third annual report of the Water Supply Board, for the year ended June 30, 1973.

John J. Tierney was reappointed a member of the board for the ensuing term ending on the first Monday in January 1977.

The board held regular semiweekly meetings throughout the year at which careful consideration was given to the many problems arising in connection with maintenance and operating activities, the department's financial structure, matters relative to taxes levied on property owned in nearby communities, and other miscellaneous departmental duties which properly come before the board. Special meetings were held as required throughout the year for consideration of particular problems.

The report of the Chief Engineer is appended hereto. It contains many important tables and statistical data, to which we invite your attention for details and particular information regarding the finances of the department and conduct of the work during the above period.

Respectfully submitted,

WATER SUPPLY BOARD
John A. Doherty, Chairman

REPORT OF THE CHIEF ENGINEER

Providence, R. I.
July 1, 1973

WATER SUPPLY BOARD CITY OF PROVIDENCE

Gentlemen:

The following is the report of the Providence Water System for the fiscal year ended June 30, 1973.

Precipitation and runoff this past year not only continued to be high but exceeded the amounts recorded during the substantially wet year of July 1, 1971–June 30, 1972. The totals were 67.46 and 39.21 inches, respectively, the precipitation being a new maximum of record and the runoff the second highest for the 57-year (July 1916–June 1973) period. The former maximum precipitation of 63.19 inches, and the still-existing record runoff of 40.97 inches, occurred in the year ended June 30, 1956.

As might be expected from a record total of 67.46 inches of precipitation, the consumption tailed-off to 63,571,000 gallons per day, or 829,000 gallons per day less than during the previous year. The maximum day's use was 105,853,000 gallons on June 11, 1973, the highest hourly rate being 152,304,000 gallons per day. These quantities compare with 57-year highs of 109,030,000 gallons and 158,350,000 gallons per day maximum hourly rate established June 30, 1971.

Water sold to East Providence, Warwick, Kent County Water Authority, State Institutions, East Smithfield Water Company, Smithfield Water Department, Greenville Water District, and to the City of Cranston for distribution to its western section totaled 5,840,069,024 gallons, an average of 16,000,189 gallons per day. Summaries relating to quantities metered to these customers are in Tables 40, 41 and 42 of the Appendix.

Due to the record rainfall, it was necessary to release large amounts of water from Scituate Reservoir. It was discharged through the water wheel located in the Gate House structure at Gainer Dam and then into the north branch of the Pawtuxet River. The wheel operates a large generator which produces power; surplus energy over and above what is required at the Philip J. Holton Water Purification Works is sold to the local power company. The total kwh generated during the year amounted to 6,807,400, the fifth largest amount in the 43-year period July 1, 1930–June 30, 1973, and just about double the 3,404,000 kwh generated during the year ended June 30, 1972.

The department's two 16-millimeter sound films in color, entitled "Pipeline For Tomorrow" and "Pure Water—Lifeline of Providence", were shown to groups during visits to the treatment plant. The first of the two, which is a pictorial review of the Major Construction Projects completed in 1970, was viewed mainly by student and professional engineers. The other film also was screened for these people, in addition to

showings for lay persons and those students having a general interest in water supply. It describes the source of supply, forestry operations, the collection, treatment, transmission, distribution, and pumping of the water, together with engineering activities, maintenance and servicing, metering, and billing.

On October 24, 1972 the concrete-lined south coagulation basin was removed from service for periodic cleaning operations. At that time it was observed that 33 slabs were in danger of sliding from the slopes into the bottom of the basin. Authorization was obtained to correct this emergency by engaging the Fanning and Doorley Construction Co., Inc. to demolish and remove these sections, grade the areas with gravel, and construct new concrete replacements. This work was done while the plant labor force was cleaning the basin. Finally, on November 20, when repair and cleaning work were completed, refilling with treated water was begun; the basin was full and was returned to service on November 30. The cost of repairs amounted to \$16,000.

Difficulty was experienced on December 26, 1972 when the stationary equipment operator at the hydro-electric station on Gainer Dam was unable to 'phase-in' the Westinghouse generator with the local power company. Upon recommendation of the consultant to the department on problems at the station, the synchroscope was repaired and the generator was placed back on the line on January 2, 1973. In addition to this work, a representative of the Allis-Chalmers Company inspected and adjusted the wickets on the S. Morgan Smith water wheel. Although power generation continued, the efficiency of the Lombard governor left much to be desired. Accordingly, the Sorensen Governor Service of Edgartown, Massachusetts, advised replacement of this discontinued unit with a universally-serviceable Woodward Relay Valve and Control Column Assembly. This work, along with a complete overhaul of the generator exciter and installation of necessary equipment to provide semi-automatic operation and automatic braking, will be completed during the next fiscal year.

In order to determine the concentration of heavy metals, such as lead, mercury, selenium and silver for example, and to be able to make the analyses in the most rapid, accurate and reproducible manner, an atomic absorption spectrophotometer was added to the modern facilities in the department's laboratory. This instrument, together with accessories, was purchased on June 21, 1973 at a cost of \$15,370; assembly of appurtenances and calibration of the unit will be done, for the most part, by laboratory and plant personnel. Plans call for the Chief Chemist to attend the manufacturer's training course next fall to become thoroughly acquainted with the techniques and ramifications of this sophisticated analytical tool which has found wide acceptance in treatment plant, state and federal health laboratories.

SOURCE OF SUPPLY

RAINFALL AND RUNOFF—The rainfall on the 92.8 square mile Scituate watershed above Gainer Dam was measured as usual by rainfall gauges at Rocky Hill, Hopkins Mills, North Scituate, Westcott District and Gainer Dam. A total of 67.46 inches was recorded, which was 18.80 inches more than the 57-year (July 1916–June 1973) average of 48.66 inches. This was a new maximum of record, exceeding the previous high of 63.19 inches established during the year ended June 30, 1956. The runoff totaled 39.21 inches; this was 14.56 inches more than the 57-year average of 24.65 inches, and 95.7% of the maximum of 40.97 inches which occurred during the July 1955–June 1956 year. It was the second highest runoff of record.

STORAGE, DRAFT AND YIELD—On July 1, 1972 the combined storage on the watershed, including Regulating, Westconnaug, Barden, Moswansicut, Ponaganset and Scituate Reservoirs, amounted to 42,163,000,000 gallons, or 102.2% of combined total capacity. At the end of the year the combined storage was 40,272,000,000 gallons, or 97.6% of capacity.

The total draft from the Scituate watershed for the year was 65,141,560,000 gallons, an average of 178,470,000 gallons daily. The draft for water supply purposes was 23,361,730,000 gallons, and the discharge into the north branch of the Pawtuxet River totaled 41,779,830,000 gallons.

The yield from the watershed for the year totaled 63,250,560,000 gallons, an average of 173,290,000 gallons per day. This was 64,450,000 gallons per day more than the 108,840,000 gallons average daily yield for the 57-year period July 1916–June 1973.

WATERSHED MANAGEMENT—FORESTRY OPERATIONS—Management of the Scituate Reservoir watershed is conducted under the direction of a professional forestry staff. The primary objective of watershed management programs is the supply of a quality raw water through properly applied husbandry of the land and water resources on the watershed.

Protection of the watershed's resources is not limited to the confines of the 23.93 square miles owned by the City of Providence. It is necessary to be continually alert to any land use, development, or practice which will affect the quality of runoff from any portion of the 92.8 square mile watershed. Growth of suburbia on the watershed has escalated potential problems of contamination of tributary streams. Trespass pressures continue to increase. Incidents of vandalism and damaging trespass by off-road vehicles plague the department.

The Tunk Hill Fire Tower was manned by our force on 33 high-hazard days during the year in close coordination with state and local firefighting agencies. Prompt suppression efforts limited six forest fires to less than two acres.

An infestation of gypsy moth (*Lymantria dispar*) developed in watershed forests as predicted in our 1972 Annual Report. An approved spray program was conducted by the State of Rhode Island; however, treatment occurred late after significant defoliation and spread of the insect had taken place. Defoliation of a substantial proportion of the watershed forests is anticipated in 1974 if timely control measures are not accomplished. *Fomes annosus* root rot continues to cause mortality in coniferous plantations. Treatment of stumps with borax appears to be an effective control in uninfected forest stands.

Forest-culture operations carried out during the year consisted of thinning, tree harvest, improvement of existing forest stands, roadside beautification, and tree planting. Major impetus was given to tree-release work on 65 acres which were planted to tree seedlings in the past decade. An estimated 329,000 board feet of timber products were harvested from watershed forests by contractual woods operators. Over 22 miles of forest access roads were upgraded or provided brush-control treatment during the year.

Prudent management was applied to turfed areas at the Philip J. Holton Water Purification Works, Gainer Dam, distribution reservoirs, and other facilities. Prior to the spring growing season, the middle berm on the west end of Gainer Dam was extended 250 feet to expedite access and use of turf maintenance equipment. Nursery stock was planted on the south portion of the Administration Building grounds on Academy Avenue, and surrounding the Transformer Building at the Purification Works. Repair of vandalized facilities, installation of fencing and gates, maintenance of aqueducts and rights-of-way, and other routine work were completed as required.

LABORATORIES—The chemical and bacteriological laboratories that check the quality of the water supply from the raw water impoundments to the taps at the consumers' premises, conducted tests on approximately 14,000 samples during the year. They were obtained from brooks, streams and raw water reservoirs, as well as daily samples collected throughout the distribution system. Tests made on these samples included chemical, sanitary chemical and mineral analyses, and bacteriologic and microscopic examinations. The total number of tests made during the year (July 1972–June 1973) amounted to 108,670. Based on a 35-hour week, the water was receiving one test or another every 60 seconds.

Chemists carried out frequent coagulation tests on the raw water with various amounts of chemicals, simulating all the operations of the purification process for the purpose of determining the most desirable dosage to produce an excellent quality of water at a reasonable cost. Rigid laboratory control over the quality of the water exceeded the sampling requirements of the U. S. Public Health Service Drinking Water Standards. The actual number of bacteriological samples collected from our distribution system amounted to 3,224, or an average of 269 per month, a figure 40% greater than recommended by the Standards and about equal to the number required for a population of 600,000.

PURIFICATION—The water supplied to communities from the Providence system is processed at one of the most modern filtration plants in the country. Operation is all-electric from a centralized control system. Power loss is minimized and almost nil, due to the availability of three sources. . . . public, hydro-generated and auxiliary diesel generator.

All chemical feeding machines are automatically controlled in direct proportion to the volume of water being treated. They are installed in multiple units, providing standby machines that may be placed in service in case of mechanical failure. Chemicals are stored in large silos and are transferred pneumatically, by remote control, to hoppers located above each feeder.

The treatment process consists of influent aeration, mixing, coagulation, and finally filtration. Chemicals employed include ferri-floc (ferric sulfate) to coagulate microorganisms and particles that cause color and turbidity, lime to change the water from acid to alkaline to assist in the precipitation of iron and manganese and reduce corrosion in the distribution system, and chlorine to destroy harmful bacteria. Finally, fluoride is added to reduce the incidence of dental caries in children. The following quantities of chemicals were used during the year (July 1972—June 1973):—2,495,769 pounds of ferri-floc before influent aeration, 2,362,838 pounds of quicklime after influent aeration and before mixing, 110,434 pounds of chlorine prior to filtration and 298,132 pounds of sodium silicofluoride after filtration, a grand total of 5,267,173 pounds.

During the year, 23,199.59 million gallons were delivered into the distribution system, an average of 63.56 million gallons daily. The maximum hourly demand in the system was at the rate of 152.30 million gallons daily; consumption during the maximum day, June 11, 1973, amounted to 105.85 million gallons. The difference between plant production and system demands was provided from storage reservoirs on our distribution system.

DISTRIBUTION

At the end of the year our distribution system in Providence, Cranston, Johnston and North Providence contained 4,323,579.67 feet (818.86 miles) of water mains ranging from 6-inches to 66-inches in diameter. The network consists of iron, steel, asbestos-cement and reinforced concrete steel cylinder pipe. There were 65,344 services, 16,280 valves and 5,017 hydrants in use on June 30, 1973. The amount of pipe laid during the year totaled 20,162.20 feet; 5,388.99 feet were removed, resulting in a net increase to the system of 14,823.21 feet. Services installed and removed were 710 and 143 respectively, a gain of 567. There was an increase of 87 valves, 130 having been installed and 43 removed, and a gain of 26 in system hydrants 118 installed and 92 removed.

Total water distribution was 23,203.32 million gallons, or 63.57 million gallons per day. The low service, a gravity supply, consumed 81.9%; the high service system, furnishing water to the higher elevations as well as the special high pressure fire service in the downtown business district of Providence, used 18.1%. Registration on customers' meters totaled 20,963.65 million gallons, accounting for 90.3% of the amount delivered into the system.

Leaks in the transmission and distribution mains totaled 176 during the year, 55 occurring at joints and 121 as a result of ruptured mains. Leaks at joints averaged one for every 15 miles of pipe and total leaks averaged one for every 5 miles of main. Of the 176 leaks, 87 were caused by various contractors excavating while performing unrelated work.

The number of meters on active services totaled 65,874. Small size meters in residential properties are brought into our shop every seven years for test and repairs; testing and servicing of larger meters are carried out more frequently.

ENGINEERING

The engineering staff has been engaged in the preparation of various specifications and estimates, plans for extensions of the distribution system into numerous real estate developments, and the usual problems related to the operation and maintenance of water works structures and equipment. Other work included real estate surveys, inventories and appraisals, consumer demands with respect to service requirements and proper size meters, inspection of water pipe installations, observing and conducting flow tests at various points in the distribution system and compiling pertinent data and records. Other services included computations of quantities and the preparation of monthly estimates for periodic payments on all outstanding contracts. In addition, the staff planned and supervised the repairs to the south coagulation basin, advised and assisted in modifications to the generator at the hydro-electric station, and designed the appurtenances necessary to operation of the new atomic absorption equipment installed in the laboratory.

COMMERCIAL AND ACCOUNTING

At the end of the fiscal year the department had 65,344 services. To meet the various requirements of our customers, we operated as usual on a 24-hour schedule. This included switchboard operators around the clock and two-way radio communication with our crews in the field. Day to day operations of the division also were carried out during the year, such as reading meters, notifying customers of

excessive water use, preparation of water bills, collection of delinquent accounts, investigating complaints, furnishing information to title companies and banks, processing new applications and preparing payrolls and job cost data.

Conversion of the old style meters to a remote reading system has progressed satisfactorily. During the year 3,093 installations were made, bringing the total to 19,769 since the program was initiated in May 1968.

FINANCIAL

The gross income for the year totaled \$4,221,997.66. Revenue from the sale of water alone amounted to \$3,626,330.13. The remaining income of \$595,667.53 was received from other sources, including hydrant rentals, installation of services and fire supplies, miscellaneous items and the surplus in the Meter Revolving Fund. At the end of the year, unpaid water bills totaled \$418,056.20, or 11.5% of the total net billing.

Expenses continued to increase. The total for the year amounted to \$4,217,849.01, up from \$2,963,084.26 last year. As usual, it is anticipated this item will become substantially greater due to inflation, higher wages and energy costs, and the price of money to float bond issues such as the one which was necessary for the Supplemental Tunnel and Aqueduct.

Principal payments on serial bonds outstanding amounted to \$245,000.00 which was paid from the general fund. Bonded debt at the close of the year was \$13,095,000.00. Interest charges paid from the general fund totaled \$722,215.00

Financial accounts of the department, together with other statistical data for the year ended June 30, 1973, are appended to this report.

Respectfully submitted,

John E. Rogers, P.E.
Chief Engineer

Raw water treated with Ferri-Floc before Influent Aeration.
 Quicklime added to Ferri-Floc treated water in conduit to tangential mixer.
 Chlorine added to water before filtration.
 Sodium Silicofluoride added to water after filtration.
 Raw water drawn from lower intake at Gainer Memorial Dam all year.

Town of West Warwick	8.940	34,740.00	0	34,740.00	4.30	1,493.82
Total Real Estate	15,447.896			\$15,740,300.00		**\$925,777.18

*Includes \$15,625.00 Tangible Personal.

**In addition to this amount, \$79.98 was paid to the West Gloucester Fire District, \$7.45 to the Harmony Fire District and \$797.91 to the Johnston Sanitary District.

NOTE: Cranston was paid three installments totalling \$40,864.72 @ \$5.50 per \$100 tax rate and one over-payment of \$14,381.40 @ \$5.50 per \$100 tax rate.

TABLE 56
SUMMARY OF STATISTICS
PROVIDENCE WATER SUPPLY BOARD
YEAR ENDED JUNE 30, 1973

*PROVIDENCE (City or Town)	PROVIDENCE (County)	RHODE ISLAND (State)
GENERAL STATISTICS		
Population of Providence (1970 Federal Census)		176,920
Estimated population supplied in suburbs		253,895
Total population supplied		430,815
Date of Construction	1870-76; 1915-28; 1935; 1938-40; 1954; 1960-1962; 1966-1970	
By whom owned	City of Providence	
Source of Supply	Surface water collected in Scituate Reservoir and five smaller reservoirs on north branch of Pawtuxet River.	
Available storage capacity of six impounding reservoirs		39,746 m.g.
Mode of Supply	81.9% by gravity; 18.1% by pumping	
STATISTICS OF CONSUMPTION OF WATER		
1. Estimated population supplied		430,815
2. Total raw water influent for the year, gallons		23,361,731,000
3. Average daily raw water influent, gallons		64,005,000
4. Raw water consumption per capita, gallons daily		148.6
5. Total consumption for the year, gallons		23,203,315,000
6. Total registration on customers' meters, gallons		20,963,649,000
7. Percentage of consumption accounted for on customers' meters		90.3%
8. Average daily consumption, gallons		63,571,000
9. Per capita consumption, gallons daily		147.6
10. Gallons per day to each tap		973

*Supplying Providence, Cranston, East Providence, and portions of Johnston, North Providence, Warwick, Smithfield, Greenville, Coventry, West Warwick and Scituate.

TABLE 56 (Continued)

SUMMARY OF STATISTICS

PROVIDENCE WATER SUPPLY BOARD

YEAR ENDED JUNE 30, 1973

FILTRATION

1. Type of filters	Rapid Sand
2. Number of filter units	18
3. Capacity of filter plant	18 units @ 8.0=144 m.g.d.
4. Chemicals used	Ferri-Floc, Quicklime, Chlorine and Sodium Silicofluoride
5. Total water filtered during year, gallons	23,439,834,000
6. Average quantity filtered per day, gallons	64,219,000
7. Total filtered water delivered to the distribution system during the year, gallons	23,199,585,000

TRANSMISSION SYSTEM

90-inch Scituate aqueduct (concrete). Also, 78-inch and 102-inch supplemental tunnel and aqueduct (prestressed reinforced concrete steel cylinder pipe).

STATISTICS RELATING TO THE DISTRIBUTION SYSTEM

1. Kind of pipe	Asbestos-Cement, Cast Iron, Steel and Concrete
2. Sizes	From 6 to 66 inches
3. Installed	20,162.20 feet
4. Removed	5,338.99 feet
5. Net Increase	14,823.21 feet
6. Total now in use	818.86 miles
7. Number of leaks per mile	0.21
8. Range of pressure on mains	14 to 95 pounds
9. Range of pressure on mains (special high pressure fire service)	94 to 130 pounds
10. Number of hydrants installed	118
11. Number removed	92
12. Net increase	26
13. Number of hydrants now in use	5,017
14. Number of stop gates installed	84
15. Number removed	28
16. Net increase	56
17. Number of stop gates now in use	11,247

TABLE 56 (Continued)

SUMMARY OF STATISTICS

PROVIDENCE WATER SUPPLY BOARD

YEAR ENDED JUNE 30, 1973

STATISTICS RELATING TO THE DISTRIBUTION SYSTEM
(Continued)

18. Kind of services	Lead, Copper and Cast Iron
19. Sizes	$\frac{1}{2}$ -inch to 42 inches
20. Number of service taps installed	710
21. Number removed	143
22. Net increase	567
23. Number of services now in use	*65,343
24. Number of meters installed	977
25. Number removed or condemned	393
26. Net increase	584
27. Number of meters now in use	**65,874
28. Per cent of services metered	100

*In addition, there is a 30-inch connection off the 78-inch Aqueduct to the Kent County Water Authority pumping station on Clinton Avenue, Hope, R.I.

**Many large services have batteries of meters.

TABLE 57
YEAR ENDED JUNE 30, 1973

COMPARISON OF PROVIDENCE TAP WATER
CHARACTERISTICS WITH STANDARDS AND
QUALITY GOALS

1962	U.S. Public Health Service Drinking Water Standards	American Water Works Association Potable Water Quality Goals	Providence Tap Water
------	---	--	----------------------------

Physical Characteristics:

Color	15 units	less than 3 units	4.
Turbidity	5 units	less than 0.1 unit	0.0
Odor	3	no odor	no odor
Taste	*	no objectionable taste	no taste

Chemical Characteristics (milligrams per liter):

Arsenic	0.01	0.01	0.00
Cadmium	0.01	0.01	less than 0.002
Copper	1.	less than 0.20	0.00
Fluoride	0.80-1.30	0.80-1.30	1.00
Iron	0.30	less than 0.05	0.02
Lead	0.05	0.05	0.00
Manganese	0.05	less than 0.01	0.00
Mercury	0.005	0.005	less than 0.002
Methylene Blue Active Substances	0.5	less than 0.20	0.00
Nitrate (NO_3)	45.	45.	0.05
Phenols	0.001	0.001	0.000
Selenium	0.01	0.01	0.00
Silver	0.05	0.05	less than 0.02
Total Dissolved Solids	500.	200.	70.
Zinc	5.	less than 1.	0.0
(Common chlorinated (hydrocarbon (pesticides }			(undetectable) (above screening) (level of 0.002)

**Drinking water should contain no impurity which would cause offense
to the sense of sight, taste, or smell."
