1. *Phylogenetic relationships*—The phylogenetic relationships among the 10 species of *Phrynosoma* were determined using the parsimony method of Farris (1993) with the computer program PAUP (Phylogenetic Analysis Using Parsimony; version 4.0; Farris, 1996). The parsimony method was chosen because of the lack of a priori knowledge of the relative importance of the morphological characters used in this study. The parsimony method was applied to the morphological data using the following settings: character state changes were weighted equally, and the heuristic search algorithm was used to find the shortest tree. The parsimony method was also applied to the molecular data using the following settings: character state changes were weighted equally, and the heuristic search algorithm was used to find the shortest tree. The parsimony method was also applied to the molecular data using the following settings: character state changes were weighted equally, and the heuristic search algorithm was used to find the shortest tree.
